3 Main Reasons You Strike Your Irons Poorly

Tip #2-Continued from last week!!

2. "Open Club-Face"

The club-face is largely responsible for the starting direction of the golf ball, therefore has a huge influence on the rest of the golf swing. This links 'faults' 2 and 3 closely together.

If the club-face gets "open" during the golf swing then we have to make compensations to try and square it up at Impact.

This often results in a poor downswing sequence, a quiet lower body and even poor shaft lean at impact. These all contribute to the club "bottoming" out too early, resulting in a poor strike.

Poor wrist angles at the top of the swing are a common one that we see among golfers.

When the lead wrist gets too "cupped", the club-face can open and the toe will hang down too much. It becomes very difficult to create a good downswing sequence from here, so it is a great "position" for you to check in the mirror or on video.

Look at creating a more "neutral" lead wrist at the top of the backswing so that the club-face at least matches the lead arm (if not slightly stronger). This alone will now give your body a reason to move without the need for compensation and makes it far easier to deliver to club to the ball with a slight downward hit.

This moves perfectly to our final fault.

Final Tip #3 will be posted next week.
